

Interview Summaries

Participants: 5 smart-lighting users (ages 22–48)

Across the interviews, several clear themes emerged:

1. Preference for Simple Navigation

Participants preferred having as few navigation layers as possible. They liked it when key actions were available on the home screen, rather than having to search through categories. Complicated navigation made them feel frustrated.

2. Importance of Clear Icons and Labels

Unclear icons caused hesitation. Participants said they rely on familiar icons, especially when using a new app. Icons that clearly showed the action, such as a bulb or color wheel, helped them feel more confident.

3. Difficulty Managing Layered Menus

Participants had negative experiences with apps that required too many steps to do simple tasks, like changing color or brightness. Going through several menus slowed them down and led to more mistakes.

4. Appreciation for Real-Time Visual Feedback

Participants liked getting instant visual feedback, like seeing the color preview change as soon as they moved a slider. This helped them feel more in control and reduced guesswork.

5. Desire for Straightforward Device Setup

Device setup should be simple and guided. Confusing WiFi or Bluetooth steps, or unclear device status, made people feel frustrated.

Overall Sentiment

People want lighting apps to feel calm, simple, and predictable. Being comfortable using the app was just as important as its features. If the interface felt too technical, they were less likely to use it.
